FuXiaoling

phone： 15921501629

email： fu_xiaoling@qq.com

Education:

- **Master's Degree** — Tongji University, Computer Science and Technology, Sep 2015 – Mar 2018
- **Bachelor's Degree** — Zhengzhou University, Computer Science and Technology, Sep 2011 – Jun 2015

Technical Skills:

- Languages: Proficient in Python; familiar with Java, C++, and Shell
- Tools&Frameworks: Robot Framework, Pytest, Jenkins, Jira, Docker, Kubernetes, Grafana, Postman, Selenium
- AI: AI Agents, LangChain, RAG, Deep Learning with Python

Work Experience:

Apr 2018 – Present | Dell Technologies | ECS (Elastic Cloud Storage) | Senior Software Engineer

KV Index Engine Service Jul 2023 – Jul 2026

1. Drove an observability PoC during the testing phase; built automated scripts to collect performance metrics and feed them into InfluxDB + Grafana dashboards, enabling data-driven bottleneck analysis and regression benchmarking.
2. Designed and implemented a fully automated test suite using Pytest, covering functional, performance, fault injection, and upgrade scenarios. Developed and maintained the team's shared test infrastructure, including load injection, upgrade task integration, continuous performance monitoring, and test result upload.
3. Built and maintained Tier1/Tier2 continuous testing pipelines — integrated 21 automated Jenkins jobs, grew code coverage from 40% to 80%, and ensured on-time delivery of TP/RC/ZBB milestones.

Chunk Service Feb 2020 – Jun 2023

1. Led test design and verification for chunk-related features in Kubernetes environments; implemented 50+ test scenarios using Robot Framework, covering BTree/repo chunk functional validation, pod restarts, node reboots, and upgrades.
2. Owned functional testing for chunk EC (Erasure Coding) projects, including Streaming EC and EC Retiring.

Space Reclamation Service Apr 2018 – Feb 2020

1. Monitored and analyzed the Space Reclamation module of the ECS storage system on a daily basis. Automated metric collection across all cluster nodes via internal APIs and log parsing; correlated anomalies against service logs and produced structured daily reports.
2. Caught 100+ critical bugs during the monitoring period, mitigating data loss risks and proactively surfacing issues such as GC stalls to drive timely resolution.
3. Validated performance optimizations for GC-related features.

AI Practice

1. Designed and developed multiple domain-specific AI agents for OBS scenarios, including automated test case generation, fault diagnosis, Jenkins job failure analysis, and automated PR review handling — boosting diagnostic efficiency and expanding automation coverage.
2. Participated in an AI Hackathon and co-developed an OBS stability analysis platform for log analysis, fault diagnosis, and stability insights. My focus was the RAG pipeline: indexing OBS technical documentation into a searchable vector knowledge base, enabling the system to automatically surface relevant domain knowledge during log analysis and fault diagnosis to deliver contextually grounded responses.
